

Digital path complete

State machines, then datapath, memory, FIFOs, and handshakes

What you can do now

- You can move across number systems and encodings with confidence
- You can reason about combinational and sequential logic, FSM encodings
- You can explain adders, ALUs, memory maps, Gray FIFO pointers
- You are not writing synthesizable HDL yet

Close the track gaps

- If you mainly used browser labs, redo a few workbook sketches for the clock, reset
- If you mainly used the workbook, open any skipped browser labs for interactive challenges
- Either track works for self-study

The labs you practiced

- Here is the tools index again, the same shelf of concept labs you opened along the way
- You do not need to re-clear every challenge
- Use it as a map

Next: learn Verilog

- Verilog is where these concepts become modules, ports, and always blocks
- Start learn Verilog from the syllabus when your wrap checklist feels honest
- Keep a small practice folder for exercises
- The older combined digital-and-Verilog path is optional stretch reading, not required

Your turn

- Review the wrap checklist
- Confirm you can explain radix, two's complement
- Name one module you would revisit if a topic still feels thin
- When you are ready, take the short quiz, then continue to learn Verilog
